

## Finding the Greatest Common Factor

**Method 1** - for small numbers: List the common factors

ex) Find the GCF of 18 and 24

Factors of:

18: 2, 3, 6, 9, 18, 1      GCF = 6

24: 2, 12, 6, 4, 3, 8, 24, 1

**Method 2:** Use PF

Step 1: PF each number

Step 2: pick the prime factors common to each number

Step 3: multiply these to get the GCF of both numbers

ex) Find the GCF of 234 and 342

$$\begin{aligned} \text{GCF} &= 2 \cdot 3 \cdot 3 \\ &= 18 \end{aligned}$$

ex) What is the side length of the largest square that could be used to tile a rectangle that measures 8 in. by 36 in.?

Assume that the squares cannot be cut.

$$\begin{aligned} \text{GCF} &= 2 \cdot 2 \\ &= 4 \text{ in} \end{aligned}$$

## Finding the Lowest Common Multiple

LCM = lowest common multiple between 2 numbers

**Method 1** - start listing multiples of each - very slow

ex) Find the LCM of 4, 5

$$4 \rightarrow 4, 8, 12, 16, \textcircled{20}, 24, \dots$$

$$5 \rightarrow 5, 10, 15, \textcircled{20}, 25, \dots$$

$$\text{LCM} = 20$$

**Method 2** - Use PF

ex) Find the LCM of 28, 42, 63

Step 1: PF each number

Step 2: pick the largest power of each prime number

Step 3: multiply these to get the LCM

$$\begin{array}{ccc} 28 & 42 & 63 \\ \swarrow \searrow & \swarrow \searrow & \swarrow \searrow \\ 7 & 4 & 9 & 7 \\ & \swarrow \searrow & \swarrow \searrow & \\ & 2 & 2 & \\ 28 = 2^{\textcircled{2}} \cdot 7^1 & 42 = 2^1 \cdot 3^1 \cdot 7^1 & 63 = 3^{\textcircled{2}} \cdot 7^1 \end{array}$$

$$\text{LCM} = 7^1 \cdot 2^2 \cdot 3^2 = \textcircled{252}$$

ex) What is the side length of the smallest square that could be tiled with rectangles that measure 8 in. by 36 in.? Assume the rectangles cannot be cut.

$$\begin{aligned} 8 &= 2^{\textcircled{3}} \\ 36 &= 2^2 \cdot 3^{\textcircled{2}} \end{aligned}$$

$$\begin{aligned} \text{LCM} &= 2^3 \cdot 3^2 \\ &= 72 \text{ in} \end{aligned}$$
