

Solving Problems with 2 Right Triangles

Find the length of x.

$$\begin{aligned} \theta &= 26 \quad (22.9) \sin 26 = \frac{y \quad (22.9)}{22.9} \\ O &= y \\ A &= \\ H &= 22.9 \\ y &= 10.04 \end{aligned}$$

$$\begin{aligned} \theta &= 49 \\ O &= 10.04 \\ A &= \\ H &= x \\ \sin 49 &= \frac{10.04}{x} \\ x &= \frac{10.04}{(\sin 49)} \\ x &= \boxed{13.3 \text{ cm}} \end{aligned}$$

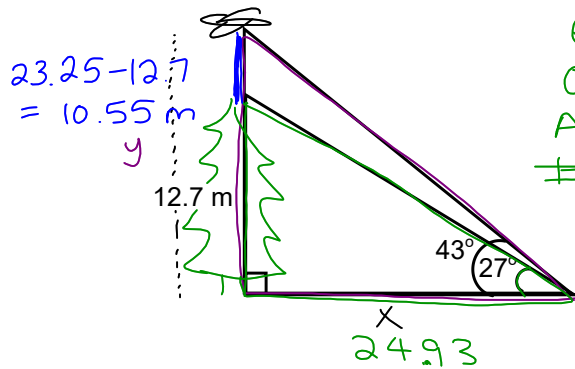

Find the measure of angle x.

$$\begin{aligned} \theta &= 34 \\ O &= y \quad (14.4) \sin 34 = \frac{y \quad (14.4)}{14.4} \\ A &= \\ H &= 14.4 \\ y &= 8.05 \end{aligned}$$

$$\begin{aligned} \theta &= x \\ O &= 8.05 \\ A &= 9.6 \\ H &= \\ \tan x &= \frac{8.05}{9.6} \\ x &= \tan^{-1}\left(\frac{8.05}{9.6}\right) \\ x &= 40^\circ \end{aligned}$$

The angle of elevation of the top of a tree is 27° . From the same point on the ground, the angle of elevation of a hawk flying directly above the tree is 43° . The tree is 12.7 m tall. How high is the hawk above the ground?

$$\theta = 27$$

$$O = 12.7$$

$$A = x$$

$$\underline{H =}$$

$$\tan 27 = \frac{12.7}{x}$$

$$x = \frac{12.7}{\tan 27}$$

$$x = 24.93$$

$$\theta = 43$$

$$O = y$$

$$A = 24.93$$

$$\underline{H =}$$

$$\tan 43 = \frac{y}{24.93}$$

$$(24.93) \tan 43 = y$$

$$\boxed{23.25 \text{ m} = y}$$

From the top of an 80-ft building, the angle of elevation of the top of the taller building is 49° and the angle of depression of the base of this building is 62° . Determine the height of the taller building to the nearest foot.

$$\theta = 62$$

$$O = 80$$

$$A = x$$

$$\underline{H =}$$

$$\tan 62 = \frac{80}{x}$$

$$x = \frac{80}{\tan 62}$$

$$x = 42.54 \text{ ft}$$

$$\theta = 49$$

$$O = y$$

$$A = 42.54$$

$$\underline{H =}$$

$$\tan 49 = \frac{y}{42.54}$$

$$y = 48.94 \text{ ft}$$

$$\text{Total height} = 48.94 + 80$$

$$= \boxed{128.94 \text{ ft}}$$
